

Sull'etica in laboratorio. Questioni propedeutiche e prospettive future

FABRIZIO RUFO

Laboratory Ethics. Propedeutical Issues and Future Perspectives

Abstract: The increasing rapidity and pervasiveness of scientific progress in every area of individual and collective human life has increased in parallel with the need to evaluate the implications of this development in terms of policy. Nodal factors such as the necessary distinction between “knowledge society” and “information society”, the responsibility of science in contemporary society and the concept of scientific citizenship in its contemporary declination, determine the most general redefinition of the relationship between science and society.

Keywords: Science, Democracy, Ethics, Scientific citizenship.
